CLIENT ACCEPTANCE HANDOFF

# MgyPack ERP Acceptance & Operating Guide

Protected browser acceptance, isolated workflow evidence, production-print recovery, and operator checkpoints

ACCEPTED IN AUTHENTICATED SESSION

## PDF printing is no longer intercepted

Native `/print`, `/pdf`, and procurement-print responses now bypass PWA navigation handling. Authenticated production-order and procurement requests reached the browser as direct **200 application/pdf** responses; the PROD-00018 download was independently rasterized and contains the expected order and BOM content.

**7**
**protected areas accepted**
Dashboard summaries, sales presentation, purchase pagination, inventory receipt surfaces, material-request lineage, completed-run correction, and production print.

**4**
**isolated workflows accepted**
Semi-finished PMR issue/return, alternative cap and allocation, native finished receipt costing, and completed-run correction passed in named isolated databases. Full affected-row fingerprints were restored; zero operational records changed.

**Acceptance context.** Company: MgyPack for Plastic Products. The session was returned to **Main Branch** after factory-specific read-only checks. The financial period was the second half of FY 2026.

## What changed

### Print reliability

Routes ending in `/print` or `/pdf`, plus dynamic procurement-print routes, are network-only. This prevents an HTML-navigation strategy from consuming PDF responses.

### Material requests

A Blade parsing defect on the protected PMR detail view was corrected. PMR-00028 now displays its run, original BOM material, selected actual material, conversion factor, and issue documents.

### BOM component choice

Semi-finished products are now valid primary components through the same active-company selector and validator used for other supported classifications. The real component selector returned a synthetic semi-finished row in isolated acceptance while keeping alternatives raw-only.

### Saved page length

Shared table state accepts only 10, 25, 50, 75, or 100 rows and is normalized both before and after custom callbacks.

ACCEPTANCE MATRIX

# Protected browser evidence

| Area | Observed result | Decision |
|---|---|---|
| Customer and supplier summaries | Date range 01/10/2026-14/10/2026 visibly included opening balances, in-period movement, and closing debit/credit sides. | **Accepted** |
| Sales-order presentation | Arabic create form visibly showed Color, Number in pieces, and Packing without exposing raw-material details. | **Accepted** |
| Purchase-order pagination | 25 rows per page remained selected after reload; the menu contained only 10, 25, 50, 75, 100. | **Accepted** |
| Finished-production receipts | Separate receipt and unpriced cost-completion pages opened with explanatory text and the correct empty states. | **Accepted** |
| Material-request lineage | PMR-00028 opened successfully and showed run, original and selected material, conversion, quantities, and issue documents. | **Accepted** |
| Completed-run correction | PROD-00010-R001 exposed the protected correction page. Separately, two existing isolated actors proved self-approval denial, second-actor approval, canonical reversals, corrected 9/1 output, and affected-row fingerprint restoration. | **Accepted** |
| Production-order print | PROD-00018 returned a direct 49,507-byte PDF with a valid PDF signature, content stream, cross-reference table, and EOF marker. The request was not served by the PWA worker. | **Accepted** |
| Other native PDF routes | PR-00003 bypassed the worker. A filtered fixed-assets report returned a complete 54,133-byte PDF directly, but took 102.874 seconds while the repository's NTFS/FUSE mount was contended. | **Accepted** **Performance caveat** |
| Semi-finished selector row | The real component Select2 controller returned an isolated semi-finished primary row; the alternative selector rejected it and still returned a raw material. The fixture was rolled back. | **Accepted** **Operational data empty** |
| Alternative material lifecycle | An over-cap planned request was rejected atomically. A 1-unit alternative request then reserved, issued, returned, and costed at 3.00 through normal services before affected-row fingerprints were restored. | **Accepted** |
| Native finished receipt | A real receipt rejected an unvalued material issue, accepted it after isolated cost completion, posted a 534.91222068 receipt and journal, then restored every affected-row fingerprint. | **Accepted** |
| Endpoint authorization | The restricted actor received 403 from issue, work-order print, and run-view endpoints. An already-authorized actor issued through the real controller with no permission grant; transaction rollback restored affected rows. | **Accepted** |

# Debt-summary values observed

### Customers

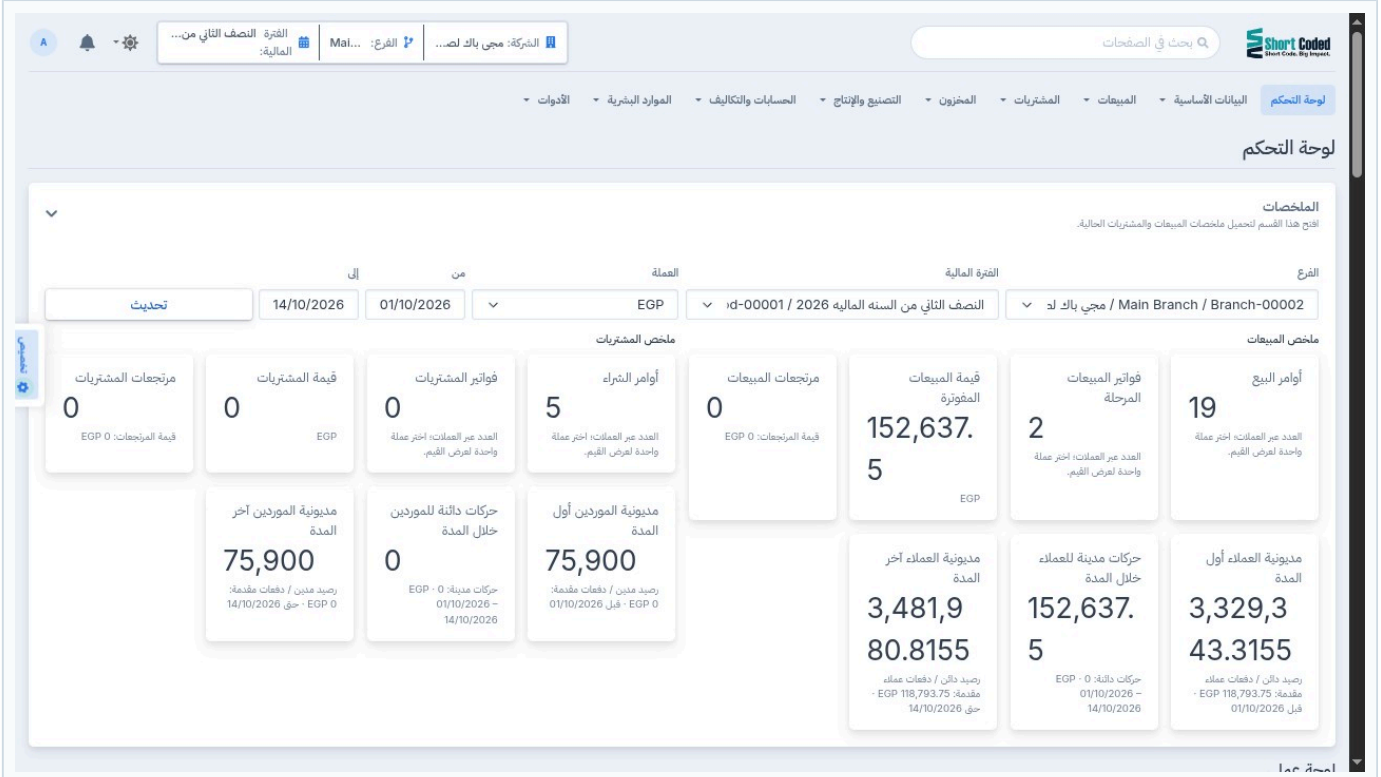

Opening debit: **3,329,343.3155**
Opening credit: **118,793.75**
Period debit: **152,637.5**
Closing debit: **3,481,980.8155**
Closing credit: **118,793.75**

### Suppliers

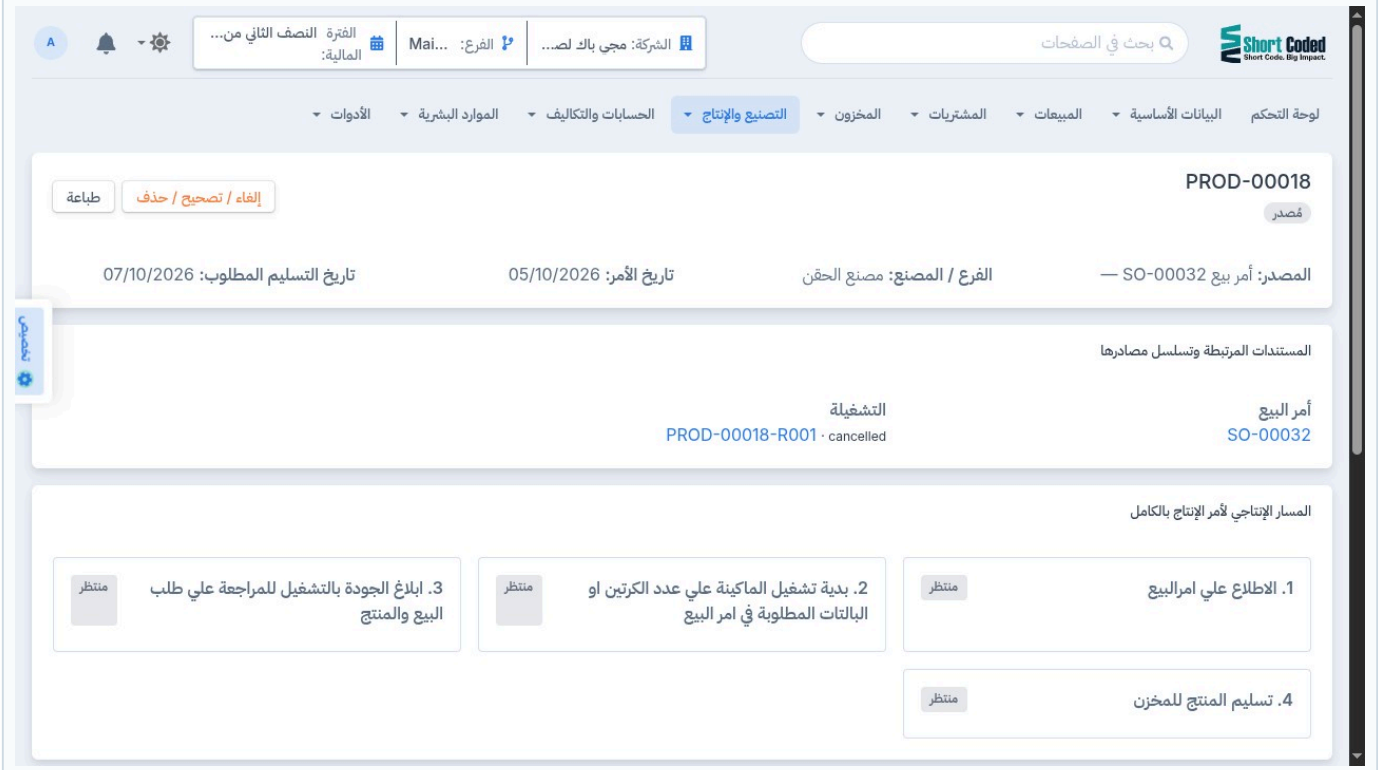

Opening credit: **75,900**
Advance debit: **0**
Period movement: **0**
Closing credit: **75,900**

AUTHENTICATED BROWSER EVIDENCE

# Light-mode operator views

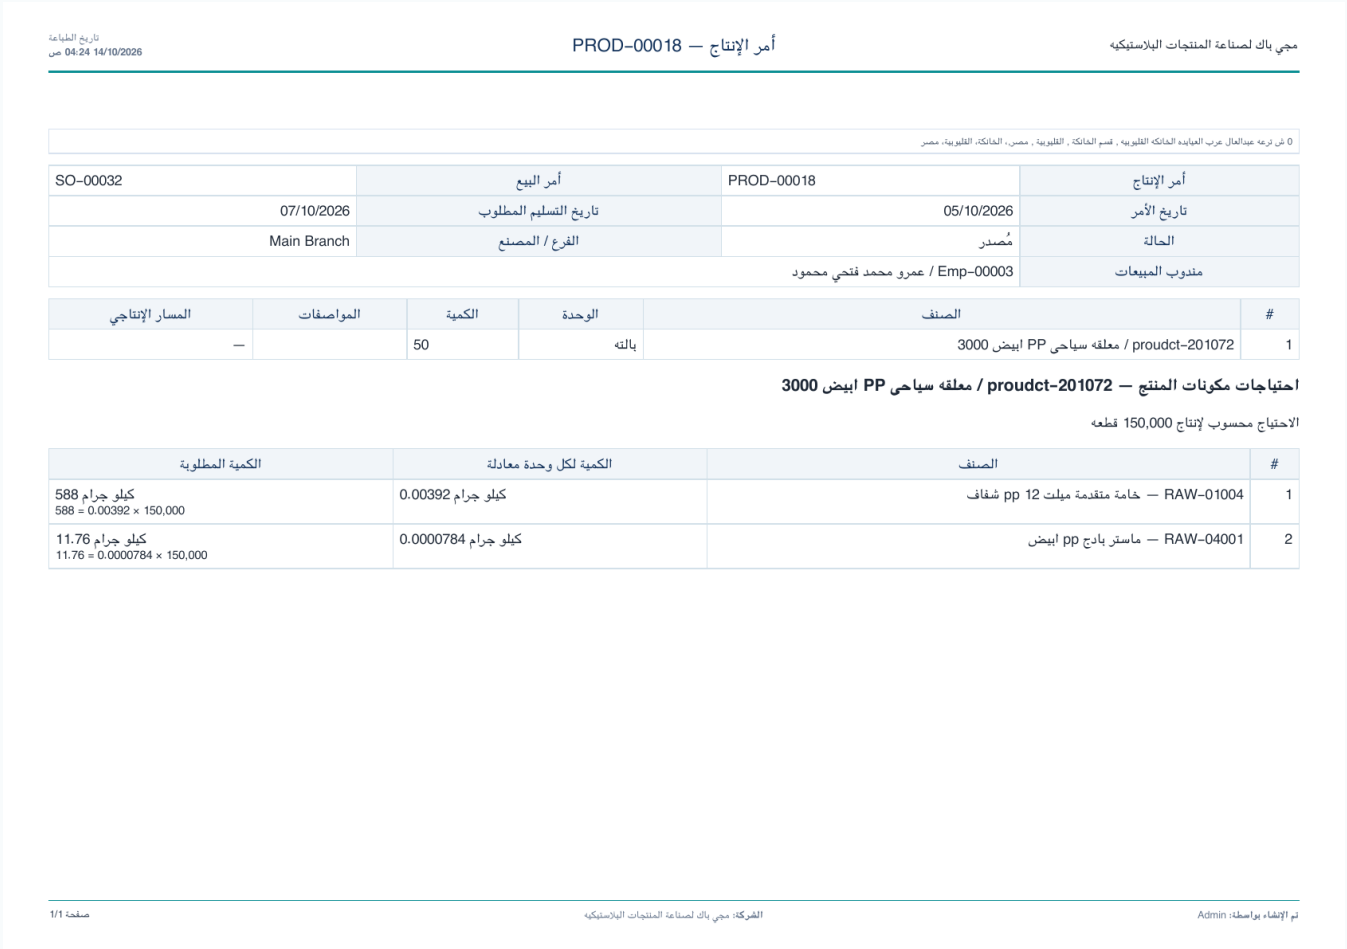

Authenticated dashboard summary after applying 01/10/2026 through 14/10/2026. Customer and supplier opening balances, period movements, and closing balances are visible in the same light-mode view.

Authenticated PROD-00018 detail page in light mode. The issued status, source order, factory, dates, linked run, and Print action are visible without entering credentials or modifying the order.

صفحة 1/1

Actual authenticated PDF download rendered at 144 DPI. The order header, metadata, product line, component requirements, calculations, and footer are all visible.

**Viewer note.** The Codex in-app browser's bundled Chrome PDF extension displays an empty dark shell and reports an internal blocked-client error even when the PDF body is valid. The application-side acceptance is based on the direct network response, authenticated download, PDF metadata, text extraction, and Poppler render shown above. Regular Chrome or Edge remains the recommended operator viewer.

OPERATOR WORKFLOW

## How to use the accepted areas

**01 - Production order print**
Open the order and choose Print. Confirm a PDF such as `production-order-prod-00018.pdf`. Activate any post-deployment PWA update once before printing.

**02 - Debt summaries**
Open Dashboard > Summaries, set From and To, then compare Opening, Period movement, and Closing. Debit and credit/advance remain separate.

**03 - Production receipts**
Use Finished Production Receipts for receipt documents. Use Unpriced Receipt Cost Completion only for a receipt awaiting its cost source.

**04 - Material requests**
Verify the linked run, original BOM material, actual material, conversion factor, and issued documents before approval or issue.

**05 - Completed-run correction**
Review inventory/journal effects, posting-period policy, reversal evidence, and independent approval. Never overwrite the original run.

**06 - Table page length**
Select 10, 25, 50, 75, or 100. The choice persists; unsupported legacy values normalize to 100.

## Release boundaries

- No test runner was used. Evidence came from syntax/build checks, protected read-only browser/PDF acceptance, and isolated transaction-wrapped workflows.
- Rollback evidence is limited to complete before/after fingerprints for the affected table rows. PostgreSQL sequence values were not reset and are not claimed as restored.
- The retained BOM actor allowed request create/view/edit/approve and denied issue, print, report, run-view, and product-edit abilities.
- The isolated browser reached the synthetic login page, but its randomized fixture credential is unavailable; authenticated isolated-browser acceptance remains blocked.
- No operational semi-finished or approved alternative/reallocation example exists; those paths passed in isolated databases and rolled back.
- The fixed-assets PDF is valid, but NTFS/FUSE contention made its response take 102.874 seconds. Production performance acceptance remains separate.
- No commit, push, deployment, permission grant, credential entry, destructive database action, or PLUMA action was performed.

**Handoff decision.** The narrow corrections, protected read-only acceptance, isolated state-changing workflows, and representative permission denials are complete. Formal production release still requires the team's focused test run, broader route-policy checks, authenticated isolated-browser access, and clean-environment performance validation.
